

ARCUS

FP&A Planning, Budgeting, Forecasting and Scenario Modelling Module

Developer Software Requirements Document

Anaplan-inspired enterprise planning system for finance teams

Field	Detail
Module	Arcus FP&A; Planning, Budgeting, Forecasting and Scenario Modelling
Product Area	Finance, Planning, Analysis, Management Reporting and Scenario Modelling
Target Users	CFOs, FP&A; managers, finance analysts, budget owners, executives and portfolio finance teams
Purpose	Provide a controlled planning workspace that connects actuals, budgets, forecasts, scenarios, workflows and reporting.
Design Direction	Anaplan-inspired worksheets, boards, reports, model builder, line items, drivers, formulas, versions and approvals.

Important implementation principle: This module must give users the flexibility of spreadsheet planning, the governance of an ERP, and the collaboration controls of a modern enterprise FP&A platform.

Contents

1	1. Plain-English explanation for developers

27	27. Security requirements
28	28. Non-functional requirements
29	29. Acceptance criteria
30	30. Glossary and final product definition

1. Plain-English Explanation for Developers

FP&A means Financial Planning and Analysis. It is the finance function responsible for helping management plan the future of the organisation. Accounting records what has already happened; FP&A helps management decide what should happen next and what is likely to happen if assumptions change.

The module must help finance teams answer practical management questions: what will revenue be, which departments are overspending, how much cash runway remains, what happens if exchange rates move, and which approved budget version should be used for board reporting.

Why this module exists: without a controlled FP&A system, finance teams export actuals into spreadsheets, circulate files by email, manually consolidate departmental budgets, and lose governance over formulas, approvals and board-approved versions.

The Arcus FP&A module must replace that uncontrolled spreadsheet process with a structured planning workspace inside Arcus.

2. Product Vision

Arcus must provide a connected planning system that links financial actuals, operational drivers, budgets, forecasts, scenarios and reporting outputs in one environment. The module must behave like an enterprise planning platform rather than a static forecasting calculator.

- Build annual budgets, rolling forecasts and long-range plans.
- Create scenario models such as Base, Upside, Downside, FX Shock and Hiring Freeze.
- Manage planning assumptions and drivers centrally.
- Compare actuals against budget and forecast.
- Request and approve variance commentary.
- Lock board-approved versions with immutable audit trails.
- Generate management reports and board packs from approved versions.

3. Core FP&A Concepts Developers Must Understand

Concept	Meaning	Developer Implementation Note
Actuals	Real financial results that have already happened.	Pull from source modules. Closed-period actuals must be read-only in FP&A.;
Budget	Approved annual financial plan.	Editable while draft; locked after approval.
Forecast	Latest management view of expected performance.	Updated regularly as actuals and assumptions change.
Rolling Forecast	Forecast that always looks forward by a fixed horizon.	Closed periods become actuals; future periods remain forecast.
Scenario	Possible future case such as Base, Upside or Downside.	Scenario stores overrides to assumptions and selected cells.
Version	Saved copy of a plan at a point in time.	Supports Draft, Submitted, Approved, Locked and Archived states.
Driver	Assumption that drives calculations.	Changing one driver recalculates dependent line items.
Line Item	Planning row or financial measure.	Examples: Revenue, Salaries, EBITDA, Closing Cash, Headcount.

Why dimensions matter: a value such as 100,000 is meaningless unless the system knows the account, period, entity, department, currency, version and scenario to which it belongs.

4. System Overview and Integrations

The FP&A module sits above operational Arcus modules. It does not replace Accounting, Payroll or Procurement. Instead, it uses their approved data as inputs for planning, forecasting and analysis.

Figure 1: FP&A acts as the planning layer above approved operational source modules.

5. Users and Permissions

User	Why They Use the System	Main Permissions
CFO / Finance Director	Owns final planning outputs and management reporting.	Approve budgets and forecasts; lock versions; view all entities; export board packs.
FP&A; Manager	Coordinates the planning cycle and builds planning models.	Create models; configure drivers; assign tasks; review submissions; create scenarios.
Financial Analyst	Performs detailed modelling and variance analysis.	Edit assigned areas; maintain assumptions; prepare reports; investigate variances.
Department Head / Budget Owner	Owns departmental budget input and explanations.	Edit own department; add commentary; submit budgets; explain variances.
Executive / Board Viewer	Reviews approved outputs and scenarios.	Read-only access to approved dashboards and locked versions.
System Administrator	Manages configuration and access.	Configure users, integrations, dimensions and security; no finance override by default.

Access must be controlled by module, model, version, scenario, entity, department, cost centre, line item and cell where required.

6. Application Navigation

- FP&A Home
- Planning Models

- Annual Budgeting
- Rolling Forecasts
- Scenario Planning
- Assumptions and Drivers
- Workforce Planning
- Revenue Planning
- Expense Planning
- Cash Flow Planning
- Capex Planning
- Portfolio Company Forecasts
- Actuals Integration
- Actuals vs Budget
- Actuals vs Forecast
- Variance Commentary
- Management Reporting
- Board Packs
- Workflow and Approvals
- Model Builder
- Data Imports
- Audit Logs
- Settings

7. UI Inspiration and Screen Philosophy

The user experience should follow Anaplan-style enterprise planning patterns: worksheets for large editable grids, boards for dashboards, and reports for board-ready outputs. Arcus must not copy Anaplan visually; it should implement the same category of planning interaction in an Arcus design system.

7.1 FP&A Home Board

FP&A Home Board

Revenue

EBITDA

Closing Cash

Runway

Variance Risk

Forecast trend chart

Scenario comparison

Budget workflow progress

Open tasks / approvals

Purpose: CFO and FP&A Manager landing page showing forecast health, workflow status and material risks.

7.2 Planning Worksheet

Planning Worksheet

Model

Version

Scenario

Currency

Cell details

Formula / comments / history

Purpose: spreadsheet-like planning grid with locked actuals, editable forecast periods, formula cells and commentary markers.

7.3 Model Builder

Model Builder

Components

Module grid

Properties + formula editor

Purpose: finance administrators configure dimensions, line items, formulas, drivers, access rules and workflows without code changes.

7.4 Scenario Comparison Board

Scenario Comparison

Base Case

Upside Case

Downside Case

Waterfall bridge

Sensitivity drivers

Purpose: compare strategic cases side-by-side before management approves a new forecast.

8. Main FP&A Workflows

8.1 Annual Budget Workflow

Figure 2: Annual budget workflow from cycle creation to board pack generation.

Why: the budget is a formal financial plan. It must be reviewed, approved and locked so users cannot accidentally change a board-approved baseline.

8.2 Rolling Forecast Workflow

Figure 3: Rolling forecasts remain current because closed periods are replaced by actuals and future periods are recalculated.

8.3 Scenario Planning Workflow

Figure 4: Scenario planning supports decision-making by testing the impact of changed assumptions before promotion to an official forecast.

9. User Stories and Acceptance Criteria

Epic	User Story	Acceptance Criteria
Planning Model Creation	As an FP&A; Manager, I want to create a planning model with entities, departments, accounts, scenarios, versions and time periods.	Model can be created; horizon selected; entities and account groups selected; empty planning cells generated; model starts as Draft; audit log recorded.
Planning Grid	As a Financial Analyst, I want to edit budget values directly in a spreadsheet-like grid.	Rows and periods display correctly; editable cells marked; formula and actuals cells read-only; edits trigger recalculation and audit logging.
Driver-Based Forecasting	As an FP&A; Manager, I want to define drivers such as revenue growth, inflation, salary increases and FX rates.	Drivers can be created by period/scenario/version; dependent cells recalculate; driver history stored; material drivers require approval.
Actuals Integration	As a CFO, I want actual results from Accounting to appear automatically in planning models.	Actuals import from Accounting; map to account/entity/department/period; read-only in FP&A; variances update; failures logged.
Variance Analysis	As a Department Head, I want to see where my department is over or under budget.	Actual vs budget and actual vs forecast calculated; favourable/unfavourable flags; commentary requested above threshold.
Version Locking	As a CFO, I want to lock a board-approved budget.	Locked versions are read-only; API edits return 403; attempted edits audit logged; locked versions can be copied but not mutated.
Scenario Comparison	As an Executive, I want to compare Base, Upside and Downside scenarios.	Metrics show side-by-side; variance from Base shown; driver differences visible; export to report supported.

10. Data Model and Dimensions

Every planning value must be stored with a full coordinate address. This is the core implementation concept behind a multi-dimensional planning system.

```
Planning Cell Address = {
Model,
Version,
Scenario,
Period,
Entity,
Department,
Cost Centre,
Account,
Line Item,
Currency,
Source Type
}
```

Dimension	Purpose	Example
Time	Planning periods	Jan 2027, Q1 2027, FY2027
Version	Saved planning version	Board Approved Budget
Scenario	Future case	Base, Upside, Downside
Entity	Legal entity	Arcus Zimbabwe
Department	Budget owner area	Sales, HR, Finance
Cost Centre	Detailed spending unit	Sales-Harare
Account	Chart of accounts line	4000 Revenue
Line Item	Planning metric	Revenue Growth %
Currency	Transaction currency	USD, ZiG
Project	Project budget	ERP Implementation
Employee	Workforce plan	Employee ID or role

Dimension	Purpose	Example
Product	Revenue plan	SaaS Licence
Portfolio Company	Fund planning	Investee A

11. Formula Engine and Calculation Rules

The formula engine is the heart of the FP&A module. It must evaluate line item formulas, drivers, actuals, assumptions and scenario overrides across all applicable dimensions.

11.1 Required Formula Capabilities

- Addition, subtraction, multiplication and division.
- Percentages and ratios.
- IF / THEN / ELSE logic.
- Prior period and time-shift references.
- Year-to-date and full-year calculations.
- Rolling averages and run-rate formulas.
- Currency conversion.
- Driver references.
- Scenario-specific overrides.
- Version-specific values.

Area	Formula	Why It Matters
Revenue	$\text{Revenue} = \text{Units Sold} \times \text{Average Selling Price}$	Connects operational volume to financial revenue.
Subscription Revenue	$\text{MRR} = \text{Active Customers} \times \text{Monthly Subscription Price};$ $\text{ARR} = \text{MRR} \times 12$	Supports recurring revenue businesses.
Revenue Growth	$\text{Forecast Revenue} = \text{Prior Period Revenue} \times (1 + \text{Growth Rate})$	Applies management growth assumptions.
Cost of Sales	$\text{Cost of Sales} = \text{Revenue} \times \text{Cost of Sales \%}$	Links cost to revenue activity.
Gross Profit	$\text{Gross Profit} = \text{Revenue} - \text{Cost of Sales}$	Shows profit before operating expenses.
Gross Margin %	$\text{Gross Margin \%} = \text{Gross Profit} / \text{Revenue};$ if Revenue = 0, return 0	Prevents divide-by-zero errors.
Salary Cost	$\text{Monthly Salary Cost} = \text{Headcount} \times \text{Average Monthly Salary}$	Connects headcount to payroll expense.
Rent Escalation	$\text{Rent} = \text{Prior Period Rent} \times (1 + \text{Escalation Rate})$	Models contract escalation.
Total Opex	$\text{Total Opex} = \text{Salaries} + \text{Rent} + \text{Utilities} + \text{Marketing} + \text{Travel} + \text{Professional Fees} + \text{Other Expenses}$	Consolidates operating cost base.
EBITDA	$\text{EBITDA} = \text{Revenue} - \text{Cost of Sales} - \text{Operating Expenses}$	Core management profitability metric.
Net Profit	$\text{Net Profit} = \text{EBITDA} - \text{Depreciation} - \text{Interest} - \text{Tax}$	Final profit measure.
Closing Cash	$\text{Closing Cash} = \text{Opening Cash} + \text{Cash Receipts} - \text{Cash Payments} + \text{Funding Inflows}$	Core cash planning calculation.
Cash Runway	$\text{Runway Months} = \text{Closing Cash} / \text{Average Monthly Net Burn}$	Shows how many months the business can operate.
Variance Amount	$\text{Variance} = \text{Actual} - \text{Budget or Actual} - \text{Forecast}$	Measures absolute performance drift.
Variance %	$\text{Variance \%} = (\text{Actual} - \text{Plan}) / \text{Plan} \times 100;$ special zero handling required	Shows materiality relative to plan.
FX Translation	$\text{Base Currency Value} = \text{Transaction Currency Value} \times \text{Exchange Rate}$	Supports USD, ZIG and consolidated reporting.

11.2 Favourable / Unfavourable Logic

For revenue:
 If Actual Revenue $\geq$ Budget Revenue, variance is favourable.
 If Actual Revenue $<$ Budget Revenue, variance is unfavourable.

For expenses:
 If Actual Expense $\leq$ Budget Expense, variance is favourable.
 If Actual Expense $>$ Budget Expense, variance is unfavourable.

For cash:
 If Actual Cash $\geq$ Forecast Cash, variance is favourable.
 If Actual Cash $<$ Forecast Cash, variance is unfavourable.

Why this distinction matters: a positive numeric variance is not always good. Higher revenue is good; higher expenses are usually bad. The system must know the line item type before assigning a favourable or unfavourable flag.

11.3 Currency Variance Logic

Base Currency Value = Transaction Currency Value $\times$ Exchange Rate
 Currency Variance = Transaction Amount $\times$ (Actual FX Rate - Forecast FX Rate)
 Operational Variance = Actual Value at Forecast FX Rate - Forecast Value at Forecast FX Rate

The system must separate currency movement from operational movement. This prevents management from blaming a department for a variance caused only by exchange rate movement.

12. Calculation Flow

Figure 5: Required calculation flow after any cell or driver change.

12.1 Circular Reference Control

A circular reference occurs when formula A depends on formula B while formula B depends back on formula A. The system must block this before saving formulas.

Example of invalid circular logic:
 $\text{Revenue} = \text{EBITDA} \times 2$
 $\text{EBITDA} = \text{Revenue} - \text{Expenses}$

Figure 6: Circular dependency example that must be rejected by the formula validator.

13. Planning Model Setup Workflow

Figure 7: Model setup workflow from model creation to opening the plan for users.

How developers should think about this: a planning model is not a single spreadsheet. It is a configured data structure with dimensions, line items, formulas, workflow rules and security rules.

14. Budgeting Module

Purpose: allow the organisation to set the formal financial plan for the year. Budgets are used to allocate resources, control spending and measure performance.

Budget inputs shall include revenue, cost of sales, payroll, operating expenses, departmental costs, project budgets, capex, tax, cash movement assumptions and funding assumptions.

14.1 Budget Owner Sequence

Step	Actor	System Action
1	FP&A; Manager	Creates budget cycle and assigns owners.
2	Arcus	Creates task list and loads prior actuals and baseline assumptions.
3	Department Head	Inputs budget lines and commentary.
4	Arcus	Validates required fields and totals.
5	Department Head	Submits budget.
6	FP&A; Manager	Reviews, approves or returns for correction.
7	CFO	Reviews consolidated budget and approves.
8	Arcus	Locks approved version and generates dashboards.

15. Rolling Forecast Module

Purpose: keep the plan current as actual results become available. Closed periods become actuals and open periods remain forecast.

Full-Year Forecast = Actuals for Closed Periods + Forecast for Open Periods

Supported forecast methods: manual forecast, prior forecast carry-forward, run-rate forecast, growth-rate forecast, driver-based forecast, seasonality forecast, AI-assisted forecast and scenario-based forecast.

16. Scenario Planning Module

Purpose: help management compare different possible futures before taking decisions such as hiring, fundraising, cutting costs or expanding.

Scenario	Purpose
Base Case	Most likely forecast.
Upside Case	Better-than-expected revenue or margins.
Downside Case	Lower revenue or higher costs.
FX Shock	Exchange rate worsens.
Hiring Freeze	No new hires.
Cost Reduction	Management cuts discretionary spend.
Fundraising Case	New funding received.
Expansion Case	New market or branch added.

17. Assumptions and Driver Library

Assumptions drive the forecast. They must be visible, controlled and approved because small assumption changes can materially affect revenue, EBITDA, cash and runway.

Category	Example Drivers
Revenue	Volume, price, growth, churn, renewal rate
Payroll	Headcount, salary, benefits, bonus
Expenses	Inflation, rent escalation, travel rate
Cash	Collection days, payment days, opening cash
FX	USD/ZiG rate, average rate, closing rate
Capex	Asset cost, purchase month, depreciation
Tax	Tax rate, QPD assumptions
Funding	Funding date, funding amount, interest rate

Inflation-linked expense = Prior Year Expense x (1 + Inflation Rate)
 Headcount-linked software cost = Number of Employees x Licence Cost per Employee
 Volume-price revenue = Units x Price
 Pipeline-weighted revenue = Deal Value x Probability %

18. Workforce Planning

Payroll is often one of the largest cost lines. Workforce planning allows finance teams to understand how hiring plans affect salary cost, EBITDA and cash runway.

- Employee or role
- Department
- Job title
- Start date
- End date
- Salary
- Benefits
- Bonus
- Employer costs
- Vacancy flag
- Hiring probability
- Scenario

Monthly Salary = Annual Salary / 12

New Hire Cost = Monthly Salary x Active Months x Hiring Probability

Total Employee Cost = Salary + Benefits + Bonus + Employer Taxes + Allowances

Headcount = Count of active employees in period

19. Revenue Planning

Revenue planning determines expected income and drives profitability, cash and valuation. The system must support contract-based, subscription-based, unit-price, customer-segment, pipeline-weighted, manual and trend-based methods.

Monthly Contract Revenue = Contract Value / Contract Duration in Months

Subscription Revenue = Active Subscribers x Monthly Subscription Fee

Ending Customers = Opening Customers + New Customers - Churned Customers

Churned Customers = Opening Customers x Churn Rate

20. Expense Planning

Expenses must be controlled by department, account and owner. The system must support manual input, prior-year growth, run-rate, contract schedule, procurement-linked, headcount-linked, event-linked, inflation-linked and one-off methods.

Run-rate Forecast Expense = Average of Last 3 Months Actual Expense

Prior-year Growth Expense = Prior Year Same Month Expense x (1 + Growth Rate)

Monthly Contract Cost = Contract Annual Value / 12

21. Cash Flow Planning

A company can be profitable but still run out of cash. Cash planning shows opening cash, inflows, outflows, closing cash, funding gaps and runway.

Closing Cash = Opening Cash + Cash Inflows - Cash Outflows

Cash Runway = Closing Cash / Average Monthly Net Burn

Cash inflows include customer collections, funding, loan proceeds, asset sales, investment distributions and interest income. Cash outflows include payroll, suppliers, rent, tax, capex, loan repayments, dividends and investment purchases.

22. Actuals Integration

Source Module	Data Pulled
Accounting	GL balances, journals, trial balance
Payroll	Payroll totals, salary costs, headcount
Procurement	POs, commitments, supplier spend
Cashbook	Bank balances and cash movements
Portfolio Management	Portfolio company actuals and forecasts
Investment Operations	NAV, valuation and fund-level data

Figure 8: Actuals sync from source records into closed planning periods.

23. Variance Analysis

Variance analysis explains why actual performance differs from plan. It is not enough to show numbers; the system must require explanations when variances are material.

Variance Type	Formula
Actual vs Budget	Actual - Budget
Actual vs Forecast	Actual - Forecast
Forecast vs Budget	Forecast - Budget
Current vs Prior Forecast	Current Forecast - Prior Forecast
YTD Variance	YTD Actual - YTD Budget
Full-Year Outlook Variance	Full-Year Forecast - Approved Budget

Figure 9: Variance commentary workflow.

24. Workflow and Approvals

The workflow module coordinates planning tasks, submissions, reviews, approvals, returns for changes and version lock-down.

- Maker cannot approve their own submission.
- Department owner can submit only their assigned area.
- FP&A can consolidate and review.
- CFO can approve final budget or forecast.
- Only authorised users can lock versions.
- Locked versions cannot be edited.
- All approvals must be audit logged.

25. AI-Assisted Forecasting

AI may support FP&A users by suggesting forecasts, detecting anomalies and drafting commentary. AI must always remain assistant-level; human review and approval are mandatory.

AI May Assist With	AI Must Not Do
Forecast suggestions	Approve budgets
Anomaly detection	Lock versions
Trend break detection	Override actuals
Variance commentary drafts	Change accounting records
Cash shortfall alerts	Submit board reports
Scenario recommendations	Replace CFO approval
Forecast confidence scoring	Publish reports without authorisation

26. Database Design

The following tables establish a controlled multi-dimensional planning foundation. Developers may extend this schema, but should preserve the separation between models, dimensions, cells, formulas, versions, scenarios and audit logs.

```

planning_models
planning_dimensions
planning_dimension_members
planning_model_dimensions
planning_line_items
planning_versions
planning_scenarios
planning_cells
planning_drivers
planning_formulas
planning_formula_dependencies
planning_actuals_snapshots

planning_comments
planning_workflows
planning_tasks
planning_approvals
planning_import_jobs
planning_export_jobs
planning_audit_logs
planning_locks
planning_ai_forecasts

```

26.1 planning_models

```
CREATE TABLE planning_models (  
  model_id UUID PRIMARY KEY DEFAULT gen_random_uuid(),  
  model_name VARCHAR(255) NOT NULL,  
  model_type VARCHAR(100) NOT NULL,  
  description TEXT,  
  owner_user_id UUID NOT NULL,  
  base_currency VARCHAR(3) NOT NULL,  
  start_period DATE NOT NULL,  
  end_period DATE NOT NULL,  
  time_granularity VARCHAR(20) NOT NULL,  
  status VARCHAR(50) NOT NULL DEFAULT 'DRAFT',  
  created_by UUID NOT NULL,  
  created_at TIMESTAMP WITH TIME ZONE DEFAULT CURRENT_TIMESTAMP,  
  updated_by UUID,  
  updated_at TIMESTAMP WITH TIME ZONE  
);
```

26.2 planning_cells

```
CREATE TABLE planning_cells (  
  cell_id UUID PRIMARY KEY DEFAULT gen_random_uuid(),  
  model_id UUID NOT NULL REFERENCES planning_models(model_id),  
  scenario_id UUID NOT NULL,  
  version_id UUID NOT NULL,  
  line_item_id UUID NOT NULL,  
  period_date DATE NOT NULL,  
  entity_id UUID,  
  department_id UUID,  
  cost_centre_id UUID,  
  account_id UUID,  
  currency_code VARCHAR(3) NOT NULL,  
  value NUMERIC(20, 4),  
  value_type VARCHAR(50) NOT NULL,  
  source_type VARCHAR(50) NOT NULL,  
  is_editable BOOLEAN DEFAULT TRUE,  
  is_locked BOOLEAN DEFAULT FALSE,  
  formula_id UUID,  
  driver_id UUID,  
  last_updated_by UUID,  
  last_updated_at TIMESTAMP WITH TIME ZONE  
);
```

26.3 planning_audit_logs

```
CREATE TABLE planning_audit_logs (  
  audit_id UUID PRIMARY KEY DEFAULT gen_random_uuid(),  
  model_id UUID,  
  scenario_id UUID,  
  version_id UUID,  
  cell_id UUID,  
  user_id UUID NOT NULL,  
  action_type VARCHAR(100) NOT NULL,  
  old_value TEXT,  
  new_value TEXT,  
  reason TEXT,  
  ip_address VARCHAR(100),  
  created_at TIMESTAMP WITH TIME ZONE DEFAULT CURRENT_TIMESTAMP  
);
```

27. API Requirements

Models

```
POST /api/v1/fpa/models  
GET /api/v1/fpa/models  
GET /api/v1/fpa/models/{model_id}  
PUT /api/v1/fpa/models/{model_id}  
POST /api/v1/fpa/models/{model_id}/archive
```

Grid

```
GET /api/v1/fpa/models/{model_id}/grid
POST /api/v1/fpa/models/{model_id}/cells/update
POST /api/v1/fpa/models/{model_id}/cells/bulk-update
POST /api/v1/fpa/models/{model_id}/cells/spread
POST /api/v1/fpa/models/{model_id}/cells/copy-forward
GET /api/v1/fpa/models/{model_id}/cells/{cell_id}/history
```

Formulas

```

POST /api/v1/fpa/tasks/{task_id}/submit
POST /api/v1/fpa/tasks/{task_id}/return
POST /api/v1/fpa/tasks/{task_id}/approve
```

Actuals and Variance

```
POST /api/v1/fpa/actuals/sync
GET /api/v1/fpa/actuals/snapshots
POST /api/v1/fpa/variance/calculate
GET /api/v1/fpa/variance/results
POST /api/v1/fpa/variance/{variance_id}/commentary
```

28. Security Requirements

The system must enforce security at module, model, version, scenario, entity, department, cost centre, line item and cell level.

User	Access
Department Head	Edit own department only.
Financial Analyst	Edit assigned model sections.
FP&A; Manager	Edit model and review submissions.
CFO	Approve and lock versions.
Board Viewer	View approved reports only.

Locked version rule: once a version is locked, no UI or API process may edit its cells, formulas, drivers, comments, workflow approvals or source values. Any attempt must return a permission error and write an audit log entry.

29. Non-Functional Requirements

29.1 Performance

- Dashboard loads within 3 seconds under normal usage.
- Large planning grids use pagination or virtual scrolling.

- Small recalculations complete within 1 second.
- Large recalculations run through background workers.
- The system supports thousands of planning cells and multiple concurrent users.

29.2 Reliability

- Prevent data loss during concurrent edits.
- Prevent broken formulas from corrupting models.
- Preserve locked versions immutably.
- Log failed imports.
- Allow import rollback.
- Maintain full audit history.

29.3 Usability

- Feel familiar to spreadsheet users.
- Make editable and locked cells obvious.
- Show formula and variance explanations.
- Allow drill-down from summary to detail.
- Avoid requiring developers to change code for normal finance model changes.

30. Acceptance Criteria

- 1 Users can create planning models with dimensions, line items, versions and scenarios.
- 2 Users can build annual budgets, rolling forecasts and long-range plans.
- 3 Users can edit planning cells in a worksheet-style grid.
- 4 Formula cells calculate automatically.
- 5 Actuals are imported from Accounting and shown as read-only closed-period values.
- 6 Users can compare actuals against budget and forecast.
- 7 Variance amount and variance percentage are calculated correctly.
- 8 Favourable and unfavourable variances are correctly classified depending on line-item type.
- 9 Users can add variance commentary.
- 10 Budget owners can submit assigned budgets.
- 11 FP&A users can review and return submissions.
- 12 CFO users can approve and lock versions.
- 13 Locked versions cannot be edited through the UI or API.
- 14 Scenario comparison works for Base, Upside and Downside cases.
- 15 Driver changes recalculate dependent line items.
- 16 Formula dependency validation blocks circular references.
- 17 The system records every material edit in the audit log.
- 18 The system supports USD, ZiG and multi-currency reporting.
- 19 Dashboards show revenue, expenses, EBITDA, cash, runway, forecast variance and workflow status.
- 20 Management reports and board packs can be generated from approved versions.

31. Glossary

Term	Meaning
Actuals	Financial results that have already happened and are imported from approved source systems.
Budget	Formal approved financial plan, normally for a year.
Forecast	Latest expected financial outlook.
Rolling Forecast	Forecast that moves forward as time passes, keeping a fixed future horizon.
Scenario	Alternative future case created by changing assumptions.
Version	Saved state of a model at a point in time.
Driver	Assumption that changes calculated outputs.
Line Item	Planning row, metric or measure.
Variance	Difference between actual and planned values.
Runway	Estimated months before cash is exhausted.
Locked Version	Read-only approved version protected from changes.

32. Final Product Definition

The final Arcus FP&A Module must operate as a full planning system for finance teams. It must allow FP&A teams to build budgets, build rolling forecasts, run scenario planning, manage assumptions, forecast revenue, expenses, payroll and cash flow, compare actuals to budget, explain variances, coordinate budget submissions, approve planning cycles, lock board-approved versions and produce management reports.

Final principle: the module should give users the flexibility of a spreadsheet, the governance of an ERP, and the collaborative planning experience of a modern enterprise FP&A platform.

1. Annual Budget Workflow

Landscape rendering for developer review and implementation handoff.

2. Rolling Forecast Workflow

Landscape rendering for developer review and implementation handoff.

3. Scenario Planning Workflow

Landscape rendering for developer review and implementation handoff.

4. Calculation Flow

Landscape rendering for developer review and implementation handoff.

5. Planning Model Setup Workflow

Landscape rendering for developer review and implementation handoff.

6. Actuals Sync Flow

Landscape rendering for developer review and implementation handoff.

7. Variance Commentary Workflow

Landscape rendering for developer review and implementation handoff.

Appendix: Detailed FP&A UI Inspiration Screens

Arcus FP&A Planning, Budgeting, Forecasting and Scenario Modelling Module

Purpose: These screens show the expected level of interface detail for developers and UI designers. They should guide layout, navigation, data density, grid behaviour, dashboard cards, workflow drawers, scenario comparison views, validation panels and overall planning workspace experience.

Implementation note: The screens are UI inspiration references. Developers must implement the Arcus business rules, permissions, workflows, formulas, audit logs and source-data integrations defined in the SRD.

Included UI Screens

1. FP&A Home Dashboard - Executive FP&A landing page with KPIs, trend charts, scenario comparison, workflow progress, over-budget departments, activity and tasks.
2. Planning Worksheet - Spreadsheet-style planning worksheet with actuals, forecast periods, editable cells, validation messages, toolbar actions and cell detail drawer.
3. Model Builder - No-code model builder with dimensions, line items, formulas, validation, dependency map, model overview and editable property panel.
4. Scenario Comparison - Side-by-side scenario planning dashboard with base, upside and downside cases, waterfall bridge, sensitivity analysis and recommendations.
5. Workflow & Approvals - Budget workflow control screen with planning cycle stages, task queue, approval history, submission progress and selected submission drawer.
6. Variance Analysis - Actual vs budget vs forecast variance analysis screen with commentary requests, department breakdown, trend chart and variance detail drawer.

UI Inspiration 1: FP&A Home Dashboard

Notes & Recommendations

Upside Scenario

Strong revenue upside driven by new logo pipeline and pricing optimizations. Recommend investment in sales capacity to capture growth opportunity.

Base Case

Balanced plan with healthy margins and cash position. Continue operational discipline and monitor macro conditions.

Downside Scenario

Revenue pressure and higher costs impact profitability and runway. Recommend cost controls and prioritizing high-ROI initiatives.

Devon Lane May 22, 2025 3:24 PM Please update marketing events budget based on new headcount plan.

Jane Cooper May 22, 2025 2:11 PM @Devon Lane updated the Q4 conference budget.

Esther Howard May 21, 2025 4:35 PM Returned IT budget for revision. See comments in task.

Marketing Department Budget

In Review Submitted on May 22, 2025 3:24 PM

Budget Summary

View in model

Metric	FY2025 Budget	FY2026 Request	Change
Total Expenses	\$8.20M	\$9.45M	↑ 15.2%
Headcount	42	48	↑ 14.3%
Operating Expenses	\$6.10M	\$7.10M	↑ 16.4%
Marketing Programs	\$2.10M	\$2.35M	↑ 11.9%

Change Notes

Increase in digital advertising spend to support new product launch. Additional headcount for growth marketing and content team. Event budget increased for two global conferences in Q1.

Variance Detail

Product Development – Headcount
May 2025

\$(0.80M)

-7.4% vs Budget

Details History

Explanation

Lower headcount due to delayed hiring for Senior Engineers and Product Designers. Open roles are expected to be filled in Q3. Savings partially offset by contractor extensions.

Corrective Action

Re-profile hiring plan into Q3 and Q4. Reallocate budget to contractor spend in the interim to maintain delivery.
